QASWA ERP

Product & Feature Presentation

The complete operating platform for finance, procurement, people, projects, service delivery and intelligent automation.

Prepared for: leadership, finance and investment reviewers | October 2026 | Commercial in confidence

Today's agenda

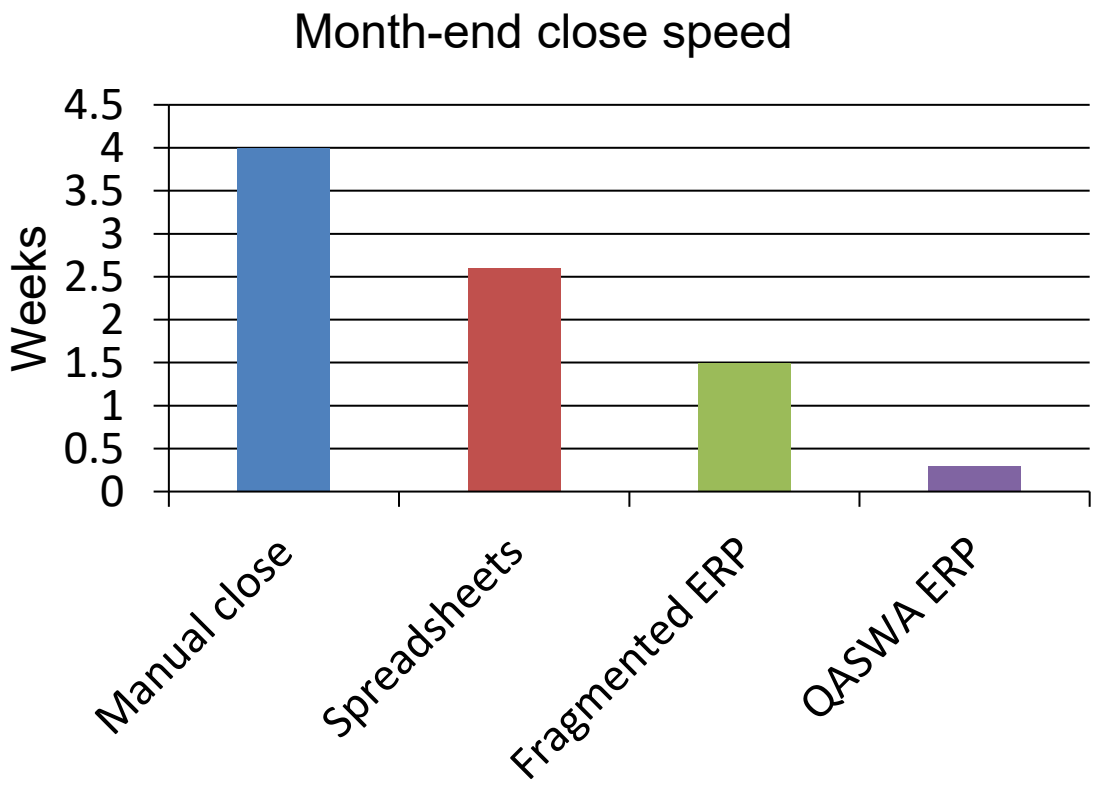

How this deck is organised

- 1 Why QASWA ERP — control, speed and evidence
- 2 The platform at a glance — 58 modules, one database
- 3 Finance — ledger, banking, receivables, payables, tax, budgets, close
- 4 Procurement — requisition to payment with three-way matching
- 5 Inventory, projects, service desk and people
- 6 Consolidation, security, AI and analytics
- 7 Implementation, return and next steps

The problem organisations are solving

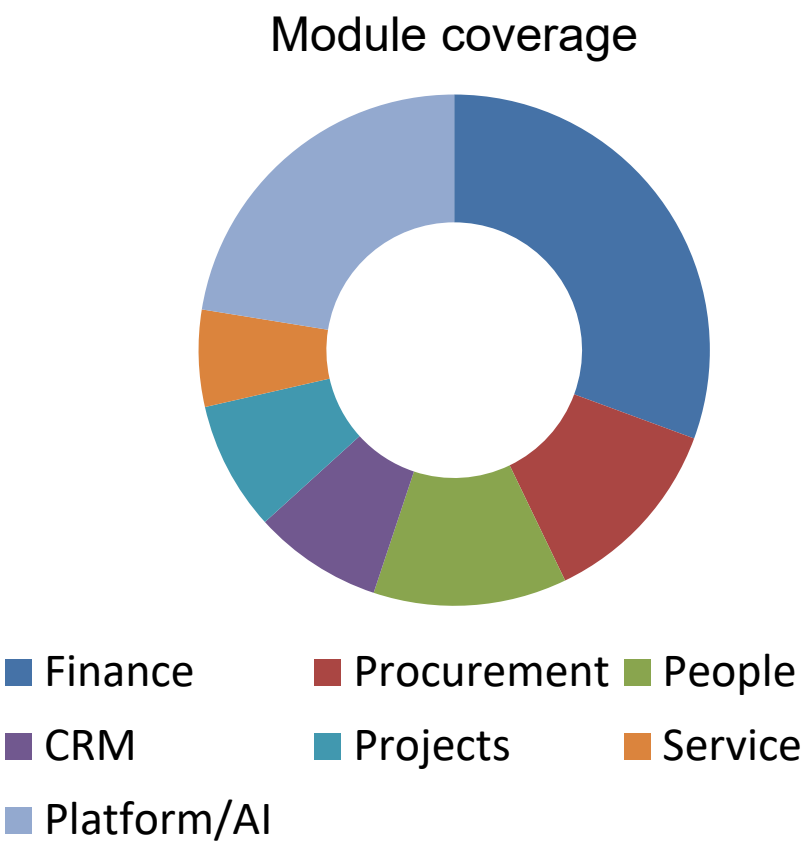

Most run four to six products, none of which agree

- Month-end closed one to four weeks after the period because reconciling subledgers is manual.
- Duplicate supplier payments, owing to missing matching between order, receipt and bill.
- Leave, attendance and payroll living in separate files that never agree.
- No drill-through from a statement line to the document that originated it.
- Every report takes days because it is re-typed rather than drilled.

The platform at a glance

58 business modules on one controlled data model

58
modules

470+
data domains

12
header dashboards

30
named reports

- Single database, single login, single audit trail — no integration project between them.
- IBM Carbon design language: IBM Plex, flat blue, light and dark themes.
- Multi-company and multi-currency from the first day.

The numbers that matter to a board

58
modules

70%
less close time

99%
match accuracy

1
audit trail

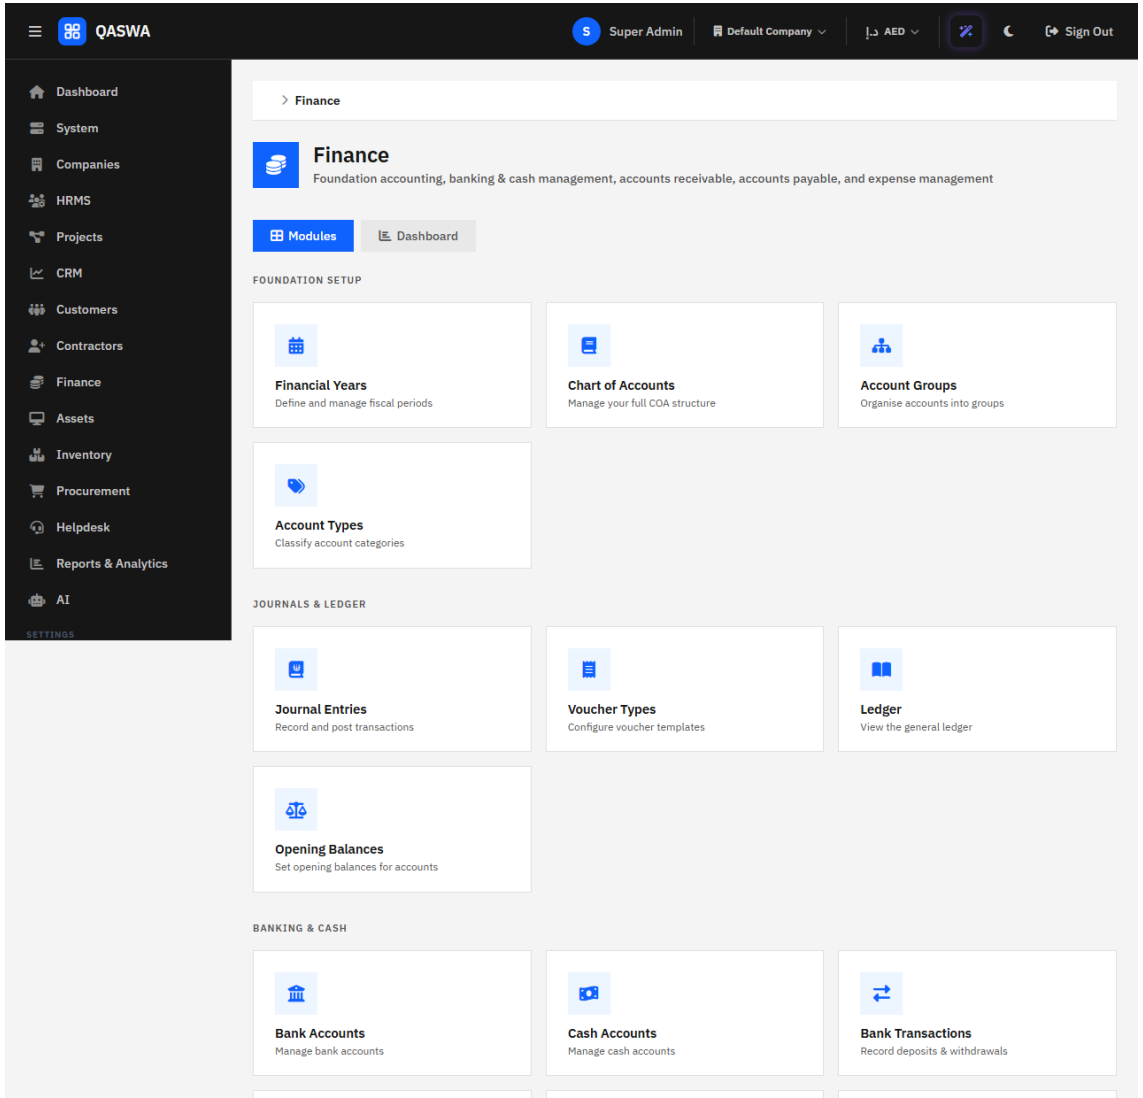

0
licence per seat

24/7
automated posting

Finance — complete double-entry accounting

From the first journal to the signed-off statement

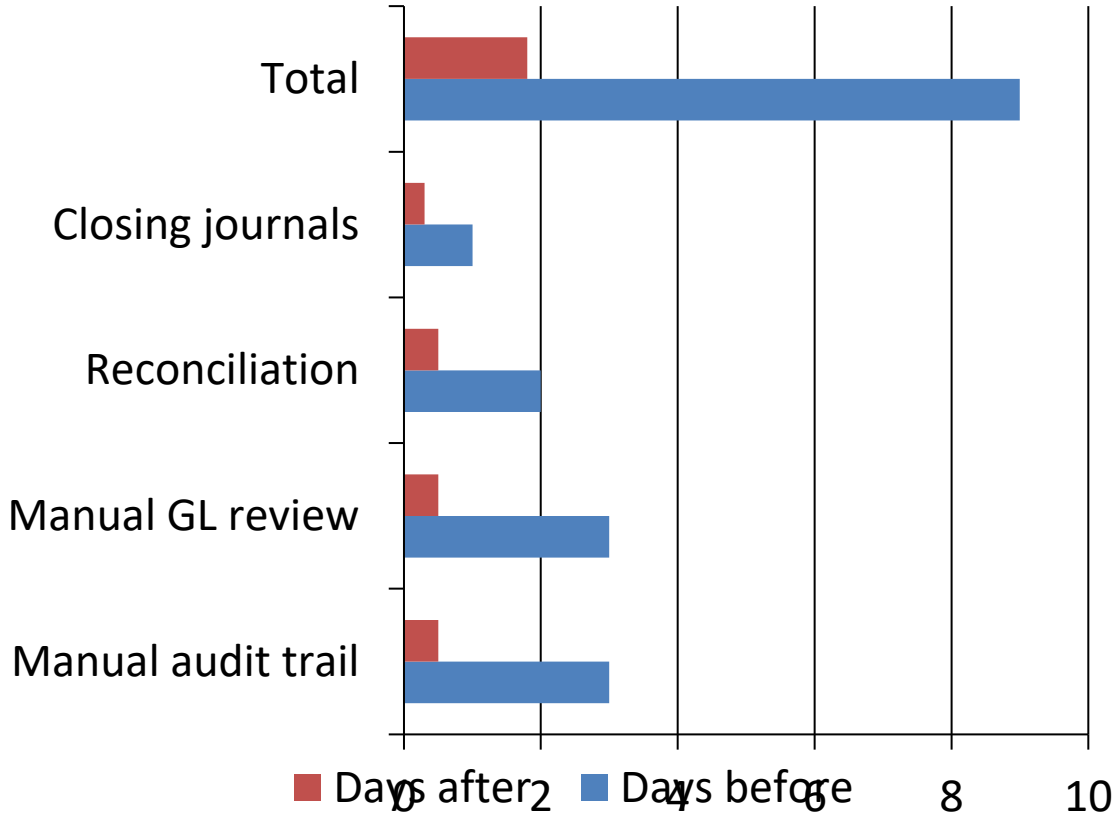

- Financial years and periods with open, closed and locked states.
- Chart of accounts with structure, accounts and posting rules.
- Five voucher types — the single controlled route into the ledger.
- Journal entry with balanced debits and credits, reversal instead of editing.
- General ledger with a running balance per account.
- GL journal audit and bank journal audit with statement-side detail.

Month-end and year-end close

A controlled event, not a project

- Reconciliation gate blocks close on any unreconciled subledger.
- Period control: no journal, invoice, bill, payroll, depreciation or even a reversal lands in a closed month.
- Closing checklist instantiated per period and per entity, with completion evidence.
- Adjustment journals with mandatory reversal dates.
- Year-end creates opening balances for the new year automatically.
- F13 group consolidation: validate, eliminate, translate, consolidate, approve.

Banking, budgets and tax

Cash, control and confidence

- Bank accounts, petty cash and inter-account transfers with opening balances.
- Bank reconciliation with an unmatched register and a clear / draft toggle.
- Budgets by department, account and period with versions, revisions and transfers.
- Encumbrance visible at posting; variance reporting to month end.
- Tax regimes: VAT, GST, sales and withholding, stacked in priority order.
- Tax register, accrual and output/input tax reconciliation.
- Live tax reports: summary, output, input, period and adjustments.

Procurement — need to approved payment in one chain

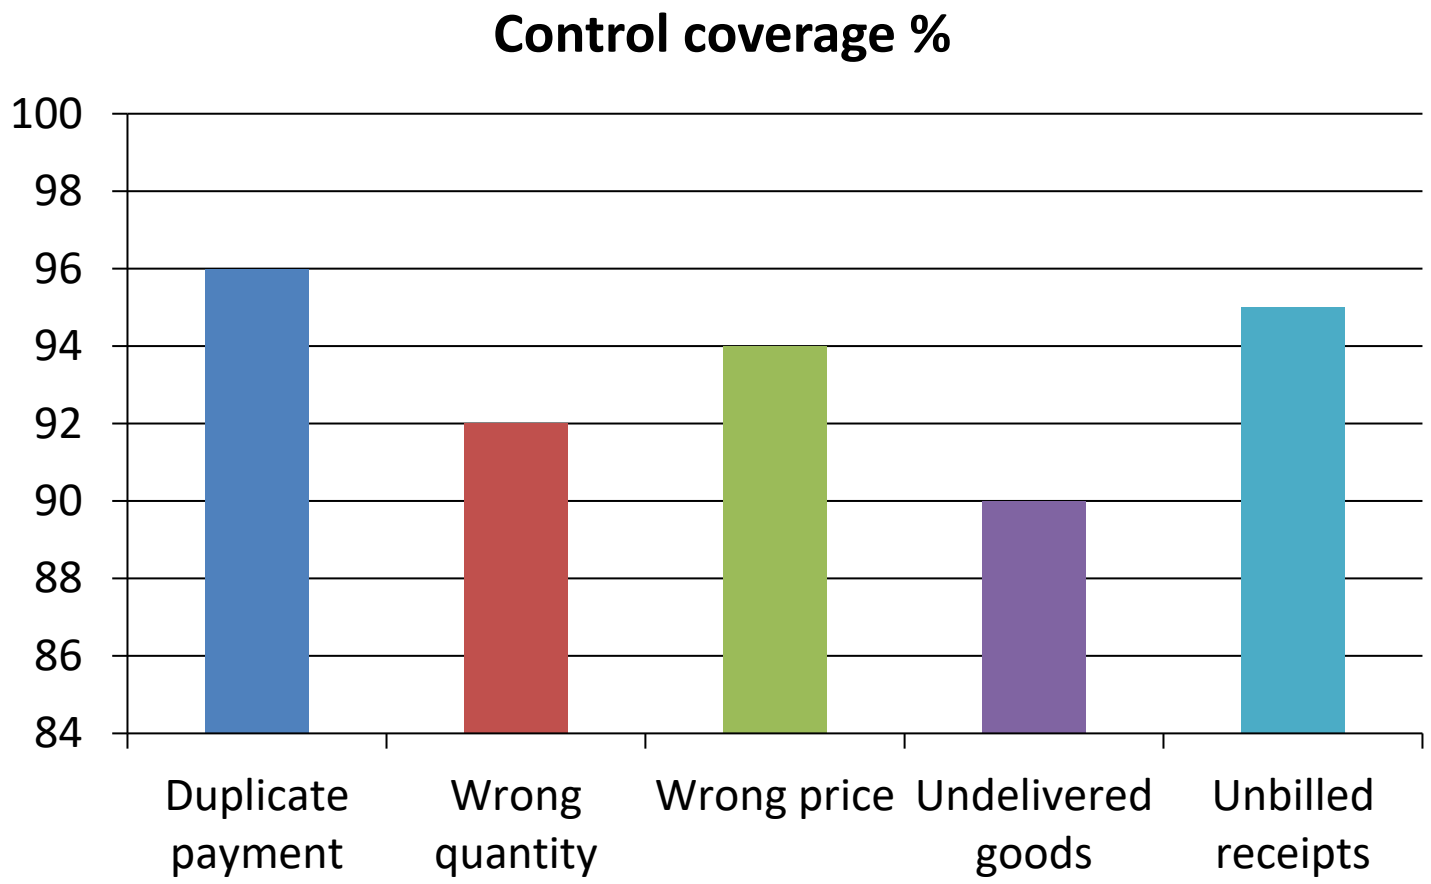

No orphan orders, no unbilled receipts

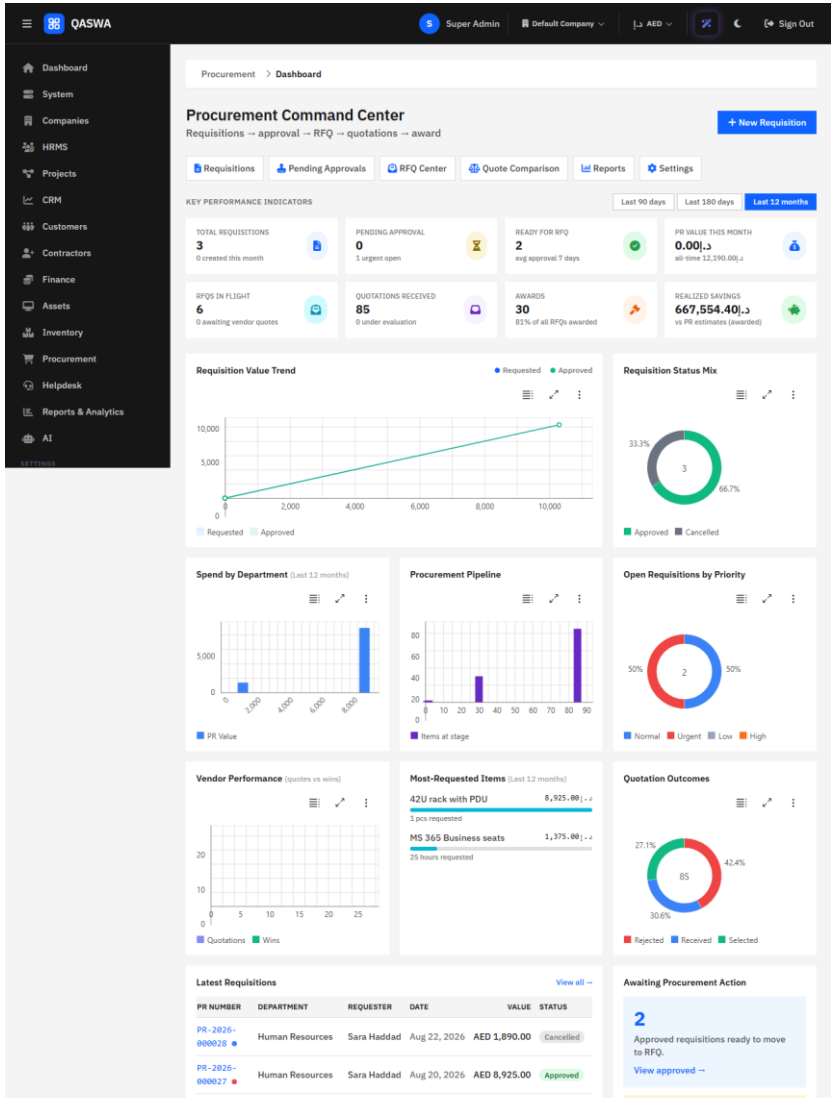

- Approval matrix by company, department, priority and amount.
- RFQ deadlines, quotations compared with weighted criteria.
- Goods and service receipt with quantity, location and QC status.
- Three-way match on quantity and price with tolerance rules.
- Debit notes for returns and overcharging close the loop.

Procurement impact

What three-way matching stops

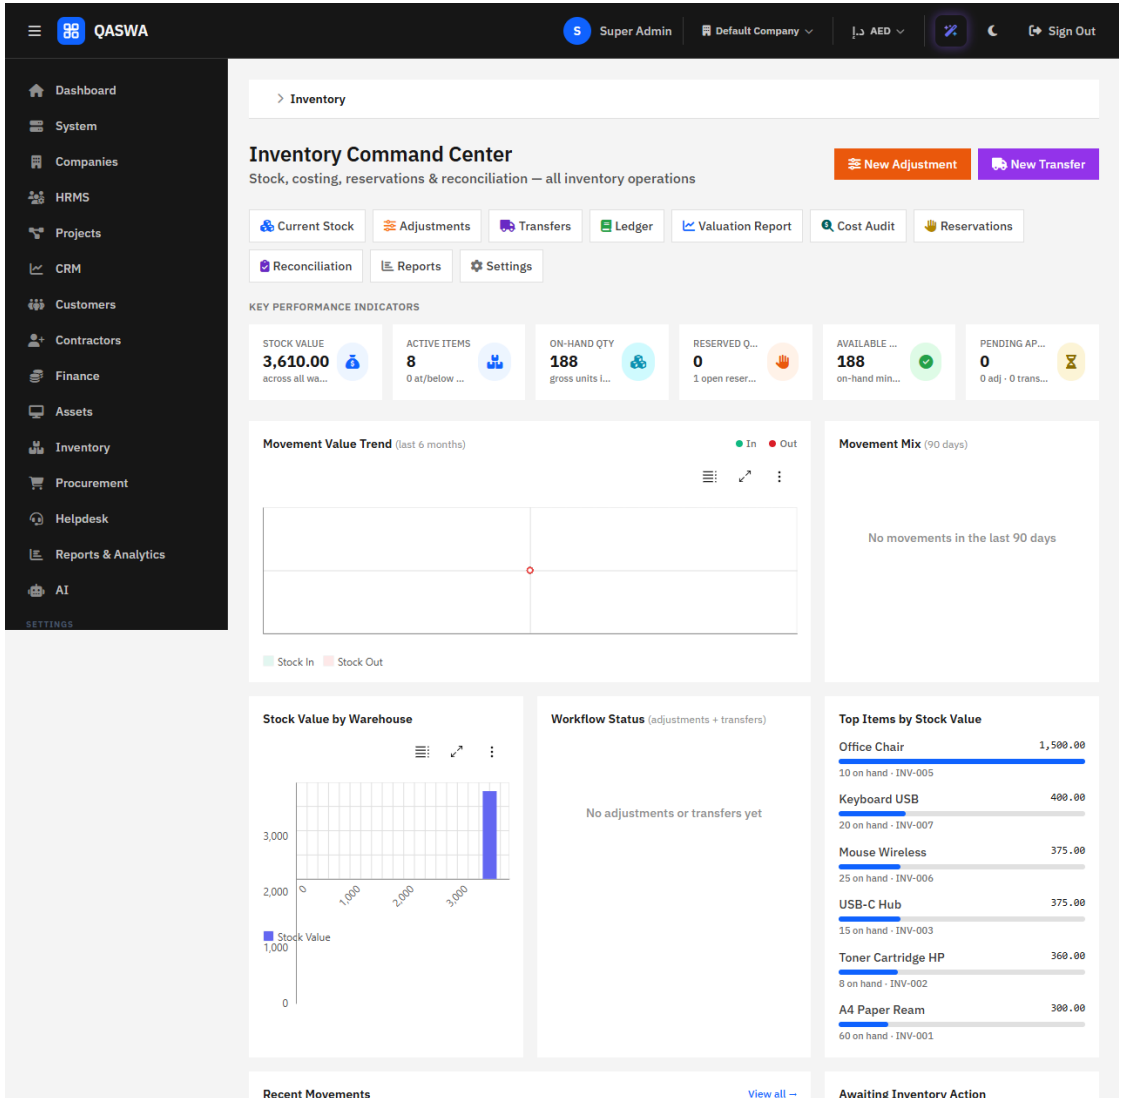

Inventory and fixed assets

What is in stock, where it is, what it is worth

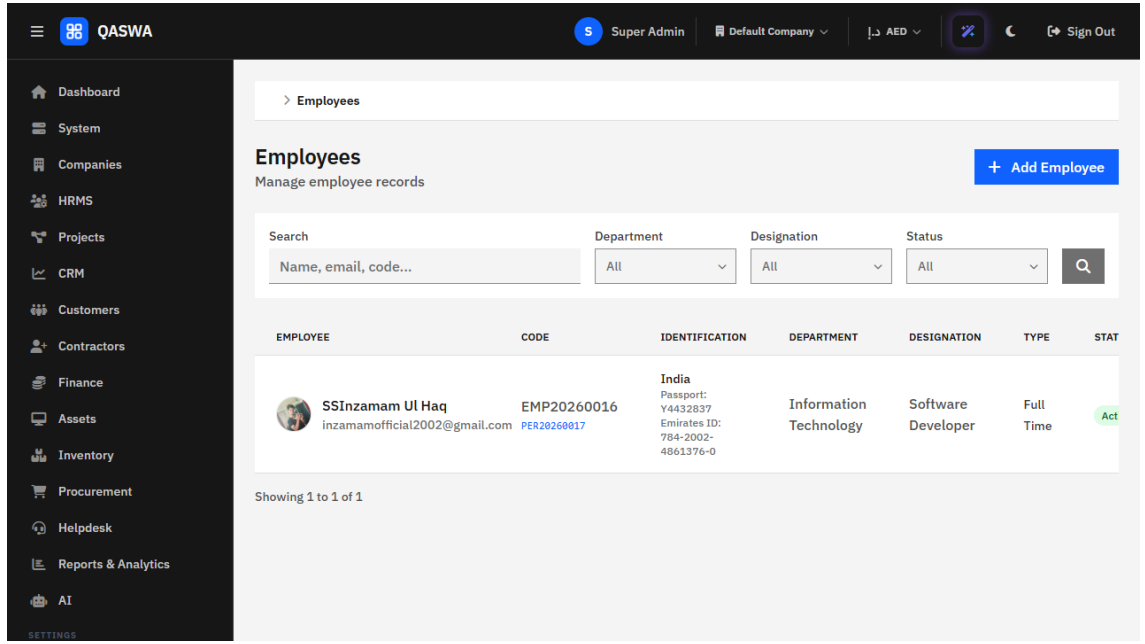

- Item master with category, warehouse, location, unit, costing and reorder level.
- Immutable stock ledger: purchase receipt, sales issue, adjustment, transfer.
- Reservations against available quantity and a live command centre.
- Fixed assets: capitalisation, depreciation, impairment and disposal.
- Straight line, declining balance and double declining balance.
- Surplus returns, movements, maintenance and licences tracked.

People — records, attendance and leave

One person record, one absence record, one payroll deduction

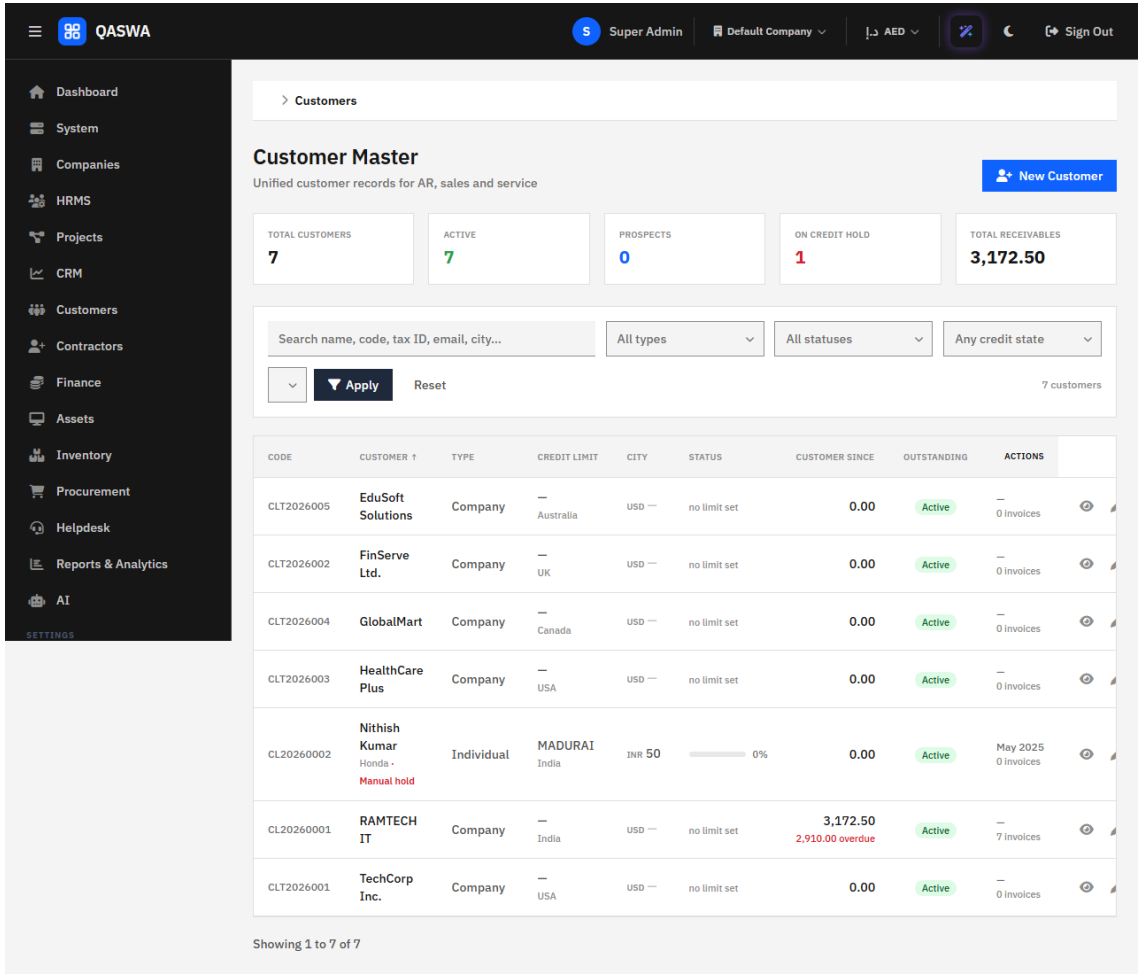

- Employee master with documents and immigration expiry watch.
- Attendance: present, absent, half day, leave, holiday, weekend.
- Leave types with annual entitlement, carry-forward and activation.
- Automatic day calculation, including 0.5 day, on requests.
- Approve, reject and balance deduction with an audit entry.
- Holidays, weekend and leave balance register per employee.

Customer relationship management

The customer record that drives every invoice and receipt

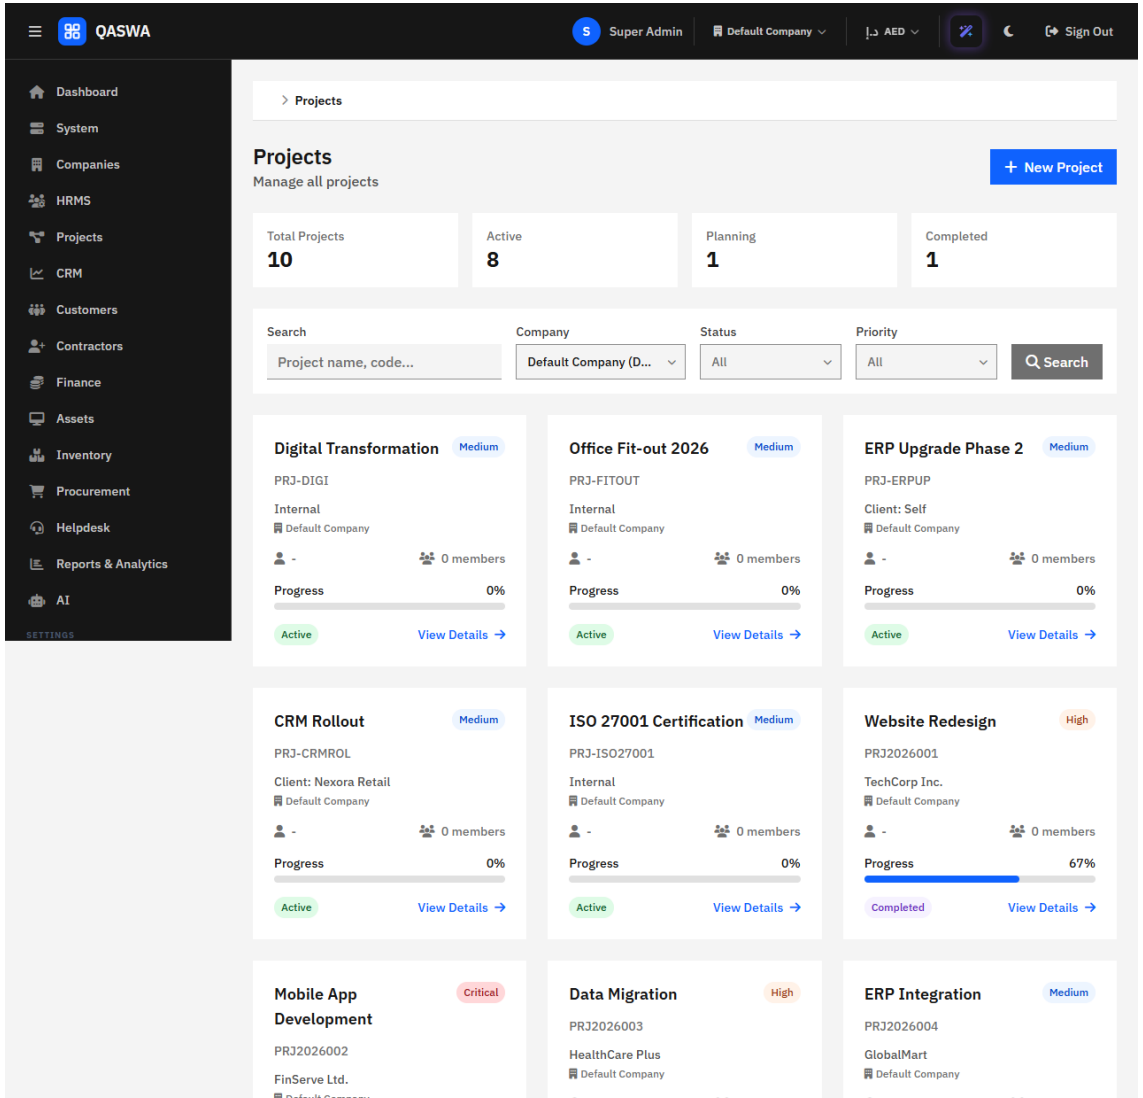

- Lead capture, qualification and follow-up register.
- Deal pipeline with probability and forecast.
- Customer master: segment, industry, country, credit limit, hold.
- Contacts, locations, notes and files attached to the customer.
- Customer 360 page: credit, receivables, recent activity, documents.
- Multi-currency billing and receivables ageing.

Projects and tasks

Table and Kanban, time against tasks, billing linked

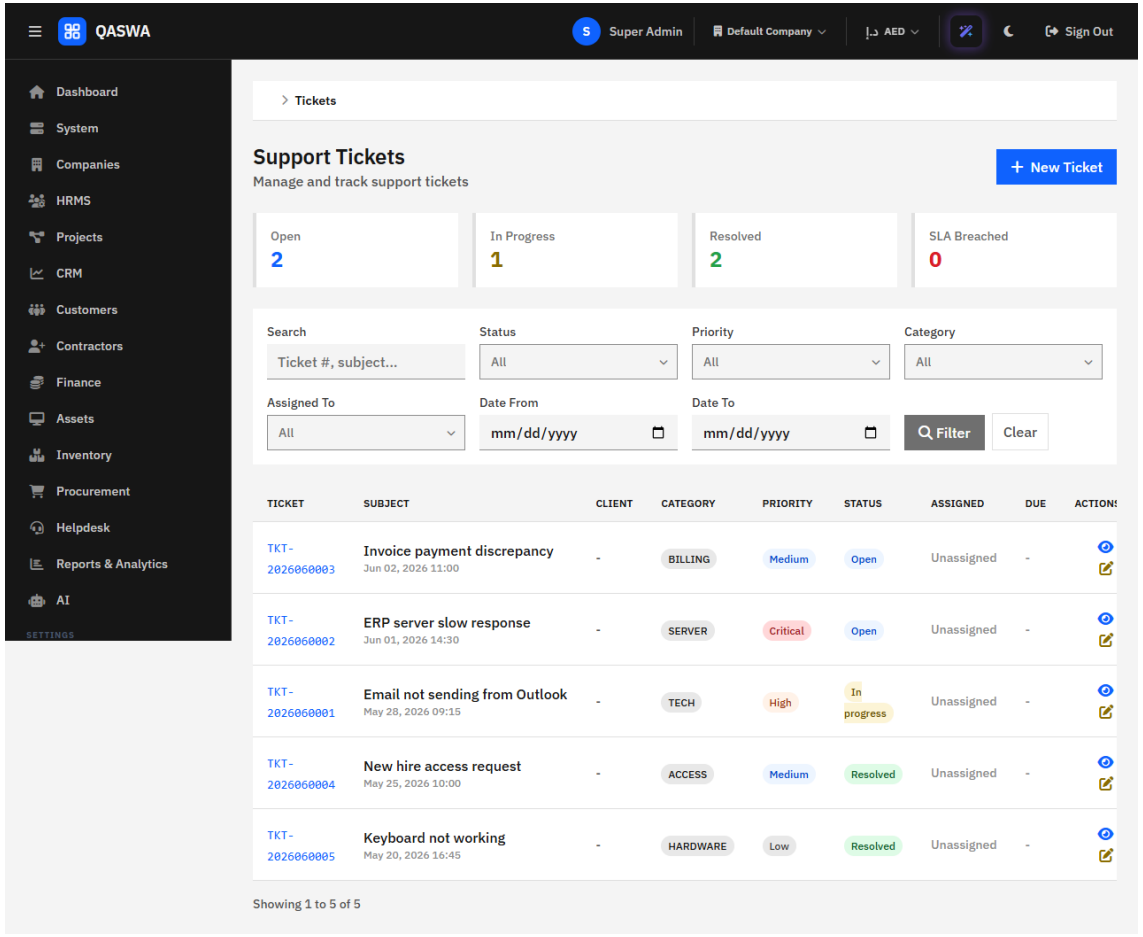

- Project register with owner, type, status and milestones.
- Task board with drag-and-drop across buckets.
- Dependencies, priorities, due dates and attachments.
- Timesheets per employee, project and task.
- Hours feed project totals, budgets and HR reporting.
- Scratchpad attachment cleanup and board persistence.

Service desk and knowledge

SLA timers that recompute while you watch

- Tickets raised with customer, priority, category and channel.
- First reply moves open to in progress and stamps first-response time.
- Owner assignment trail: from, to, who and reason.
- SLA policy define-when open, breach status live on the queue.
- Pause and resume support windows for SLA accuracy.
- Ticket categories and a published knowledge base.

Multi-company and consolidation

One login, many entities, one group view

- Active company selector in the header drives every screen.
- Permissions resolve which entities a user may see.
- Intercompany transactions: sale, purchase, service, expense, loan, interest, dividend.
- Match and reconcile across group entities.
- Period close and year-end per entity.
- F13 group consolidation: validate, eliminate, translate, consolidate, approve.
- Foreign currency translation at closing, average and historical rates.

Period close and year-end

The reconciliation gate before any month ends

- Financial dashboard: current year, period, remaining periods, checklist progress.
- Closed-period enforcement across every posting and even reversals.
- Accrual, prepayment, provision, depreciation and tax adjustment journals.
- Year-end closing: closing entries, opening balances, carried forward P&L.
- Tax subledger, payroll subledger, subledgers all attested before close.

Security and compliance evidence

Controls enforced, not recommended

- Session-based authentication with re-check on every request.
- RBAC: 58 permissions across modules, three shipping roles plus custom.
- XSS sanitisation, CSRF tokens, PDO prepared statements.
- Audit log per action with user, module, record, IP and timestamp.
- Report audit log with parameters hashed.
- Guarded maintenance console; production hides errors.
- Retention and housekeeping in the administrator's hands.

Intelligence that cannot go rogue

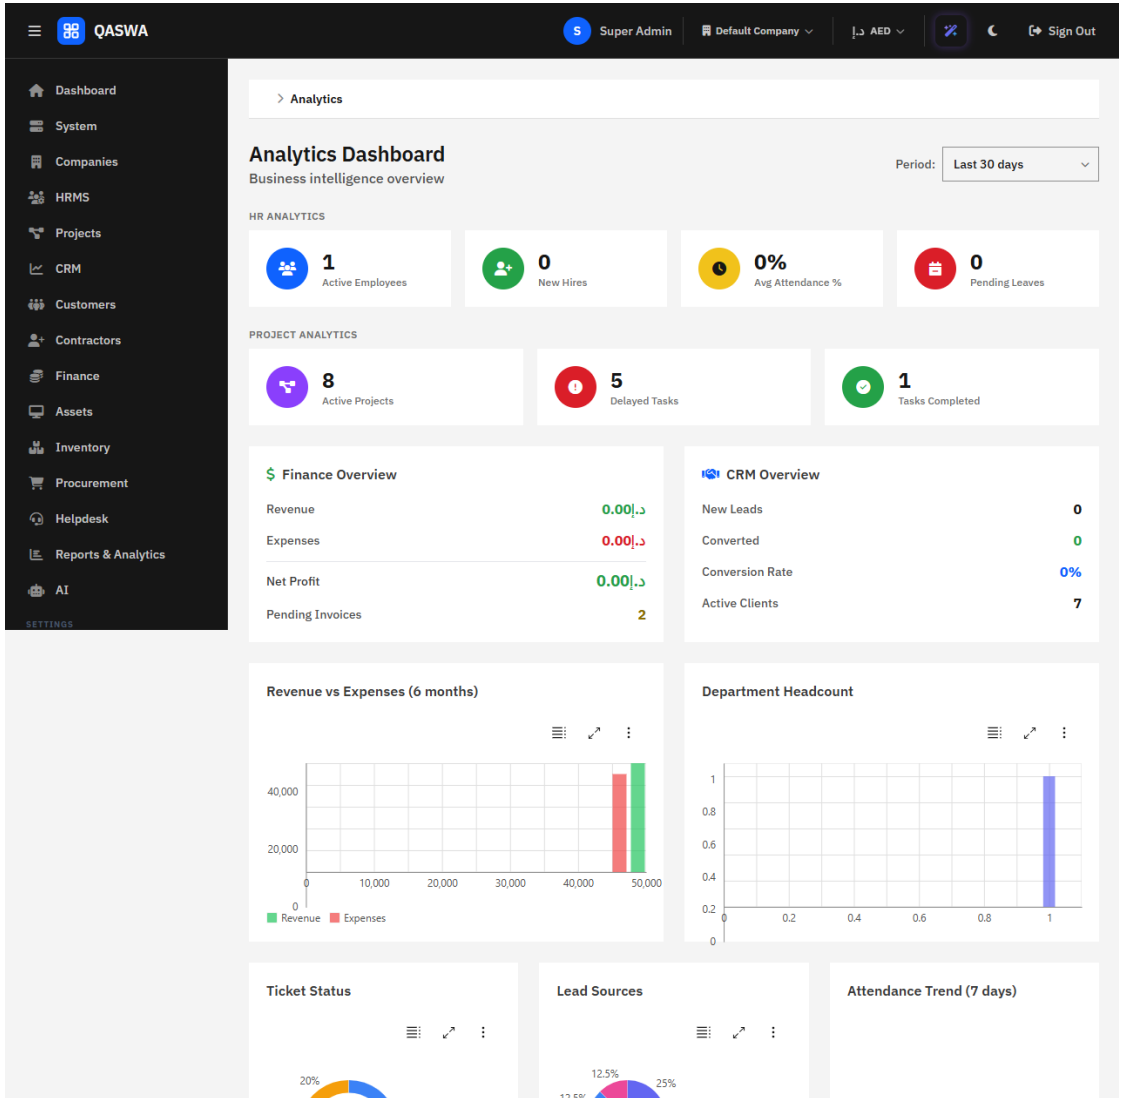

Governed AI, human-in-the-loop

- AI agents, tasks and workflows orchestrated under policy.
- Knowledge base with vector search for retrieval-based answering.
- Guardrails: kill switch, governance middleware, policy engine.
- Usage, metrics and security-event logging for every call.
- Document intelligence for extraction and review.
- Completely optional: the business works without it switched on.

Dashboards, analytics and reporting

Eleven statement sets and drill-through both ways

- Report centre with saved reports and scheduled delivery by email or file.
- Financial statements: trial balance, P&L, balance sheet, cash flow.
- Drill from a statement line to journal to the originating document.
- Financial ratios: current, quick, debt to equity, margins.
- Integrity checker with pass / warn / fail reconciliation.
- Analytics workspace and an executive dashboard.

Implementation timeline

First live month-end in twelve to sixteen weeks

Week 1-2 Company, ownership, COA, currencies

Week 3-4 People, leave, attendance

Week 5-6 Items, warehouses, procurement

Week 7-8 Invoicing, receipts, first close

Week 9-10 Budgets, tax, SLAs, tickets

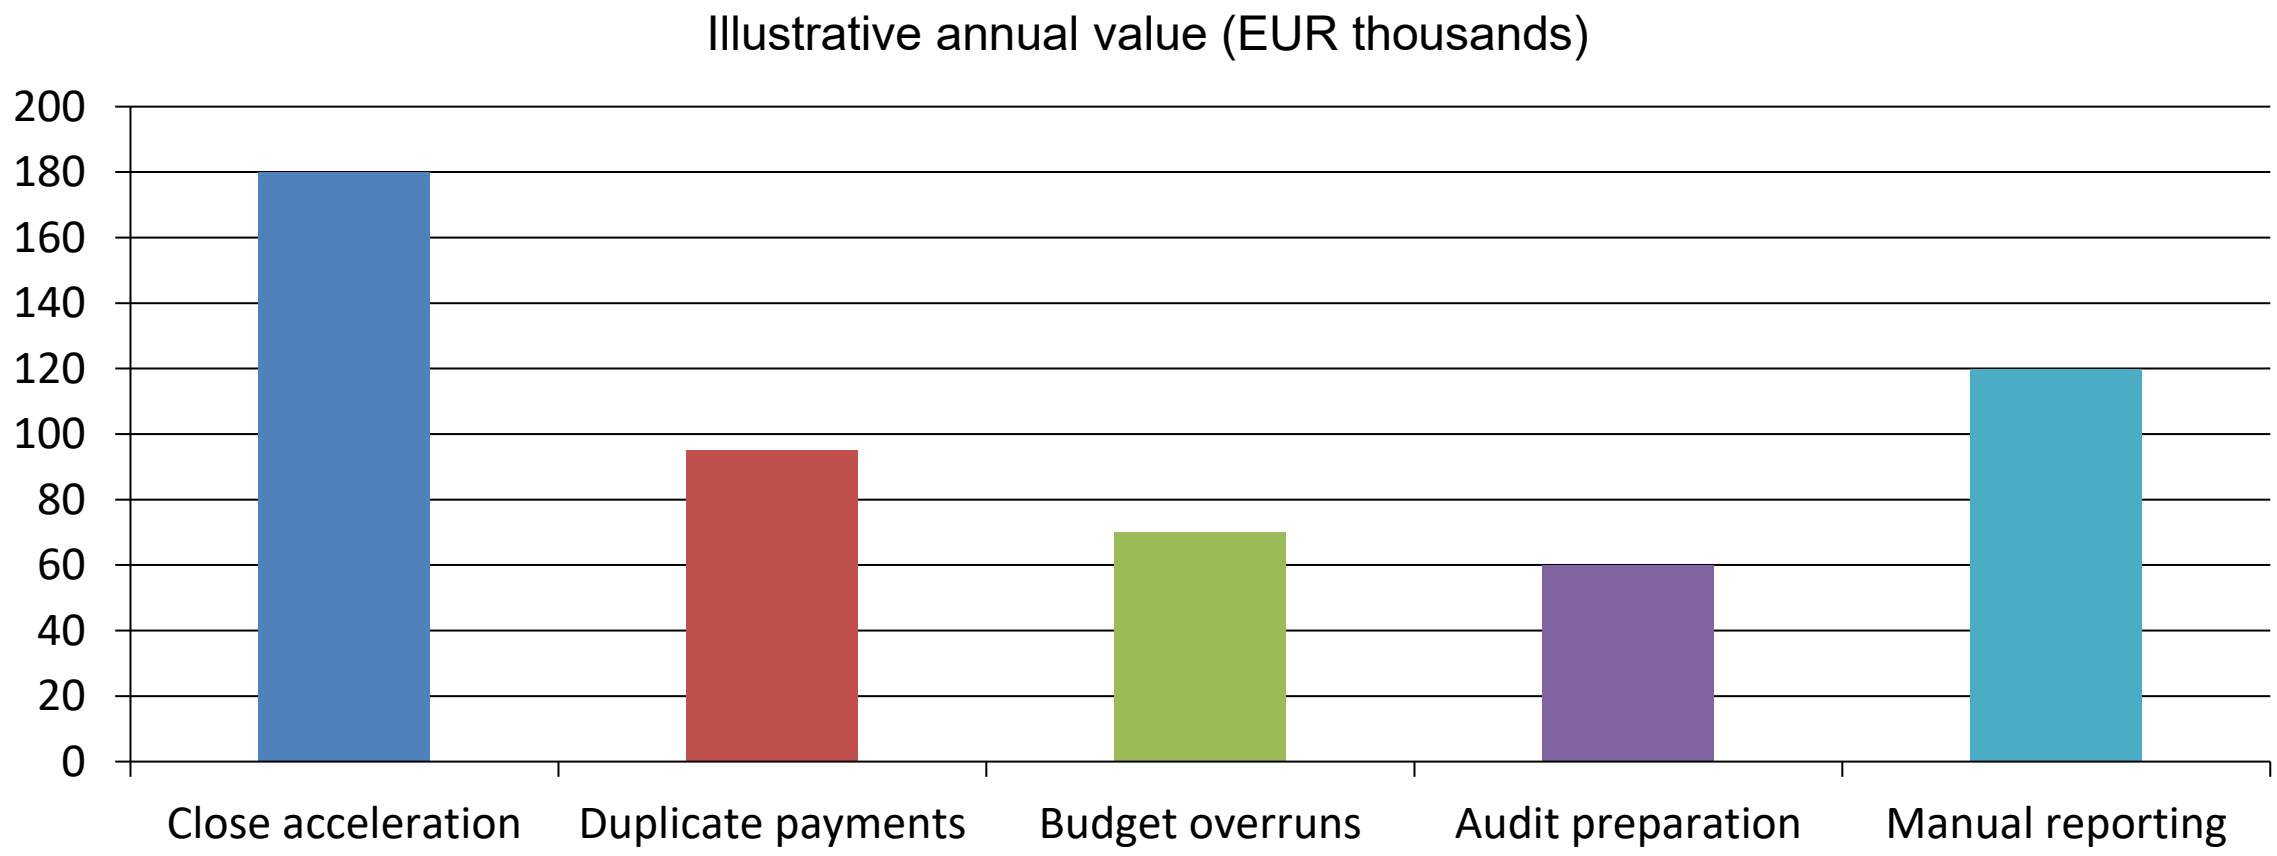

Week 11-12 Projects, timesheets, reports

Week 13-14 Approval matrix, consolidation

Week 15-16 Audit handover, steady state

The business return

Where the money comes from

Why QASWA ERP and not the alternatives

Control you can verify

- One controlled route into the ledger — voucher types, not free-form journals.
- Subledgers that must agree before a close can happen.
- No extra licence per seat; runs on standard hosting.
- Per-company document sequences, currencies, approval and audit.
- Delivered working, not as a toolkit or a configuration project.
- Plain-language documentation and a complete evaluation checklist.

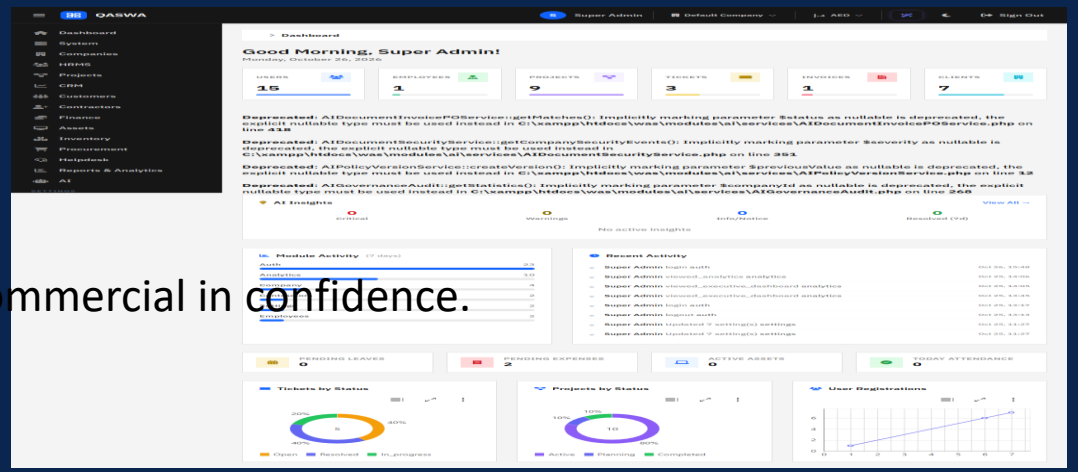

Evaluation checklist — score us

Thirty lines, five-point scale

- ☐ Run your own month-end and inspect the trial balance
- ☐ Invite your auditor to the close demonstration
- ☐ Time the chart-of-accounts migration
- ☐ Procurement with a deliberate price variance caught in matching
- ☐ Test data export and ownership terms in writing
- ☐ Visit a live installation and speak to the controller

Recommended next steps

- 1 Book a ninety-minute scripted demonstration on your own numbers
- 2 Trial tenant prepared with your chart of accounts and currency
- 3 Auditor-led review of the period-close engine
- 4 Implementation and migration plan with dates against your calendar
- 5 Data ownership terms in writing before any engagement

QASWA ERP — built for the organisation that has outgrown its spreadsheets.
